The overall model consists of five adjustable parameters, two for the continuous precipitation model and three for the discontinuous precipitation model. These parameters are listed in Table 1 . These adjustable parameters were found by fitting to cases where precipitation was dominated by one mode (either continuous or

In this work, a continuous-discontinuous approach is applied to elastic, strain-hardening and regularised strain-softening media. It is shown that the success of a continuous-discontinuous analysis depends largely on the underlying continuous model.
