### Principles Of Helicopter Aerodynamics Questions

In steady flight, the sum of thrust, drag, weight, and lift is always zero. There can be no unbalanced forces in steady, straight flight based upon Newton's Third Law.

Principles of Helicopter Aerodynamics. Second Edition. The helicopter is truly a unique form of aircraft and a mastery of modern aeronautical engineering that fulfills a variety of civilian and military roles. The usefulness of the helicopter lies in its unique ability to take off and land vertically on almost any terrain, to hover stationary relative to the ground, and to fly forward, backward, or sideways.

### Principles of Helicopter Aerodynamics

The main rotor used for helicopter aerodynamics must undergo a variety of competing forces while in flight. While the flight principles of most helicopters are well-known to the public of vertical take-offs, hovering, and sideways movement during flight, this is not the limit of a helicopter's performance characteristics.

### What Are Helicopter Aerodynamics? (with pictures)

Before talking about the aerodynamics of helicopters we first have to introduce a few basic principles of aerodynamics. In order to get aircrafts that are "heavier than air" off the ground a force has to act upwards that is at least equal to the weight of the aircraft. This force is called lift and is created by the wings.

Wing washout means the root of the wing flies at a higher angle-of-attack than the tip, and the root stalls first. This creates a more stable, controllable stall, and gives you some aileron effectiveness during the stall.
